

Abstract

An arrangement for configuring a device of a system by transferring control information from a removable controller thereto. The controller includes an input apparatus for receiving control information for coupling the device, a memory circuitry arranged to store and retrieve control information for configuring the device, and an output apparatus for transferring to the system retrieved control information for the device. The system includes apparatus for coupling with the output apparatus of the removable controller to transfer retrieved control information therefrom, and a controller arranged to configure the device independence upon the transferred control information.
